## A stimulant

## Methylphenidate (meth-il-phen-ih-date)

You should read this leaflet with your carer/care giver.

## Methylphenidate:

- Methylphenidate is used for treating the symptoms of Attention Deficit Hyperactivity Disorder (ADHD).
- Methylphenidate is sometimes used for people who are distressed. There is no clear evidence that it improves someone's behaviour.

The label on your methylphenidate packet should tell you when and how much medicine to take.

Swallow your tablet or capsule with water. If you have Concerta XL, Xenidate XL, Xaggitin XL and Matoride XL, you should swallow this whole. **Do not crush or split it**.

If you have Equasym XL and Medikinet XL, you can swallow it whole or open the medicine and sprinkle it on soft food such as yoghurt. Take it straight away and do not chew this. Equasym XL should be taken before breakfast.

If you forget to take your medicine, tell someone straight away.

You should carry on taking your medicine even if you feel better unless your doctor asks you to stop.

Drinking alcohol whilst taking methylphenidate could make the side effects of this medicine worse.

Some medicines do not work well together.

Tell your doctor if you have trouble swallowing and have Concerta XL medicine.

You should tell your doctor about any other medicines you are taking.

## Side effects:

- Medicine can have certain effects on your body that are not wanted.
- Not everyone taking a medicine will get them.
- Many will go away with time.
- Many are rare.

You might want to talk to your doctor or the pharmacist or your key worker if you have any side effect.

These are some (but NOT all) side effects of methylphenidate...

Headache

- Feeling anxious or nervous
- Socially withdrawn
- Problem sleeping
- Feeling light-headed or dizzy
- Feeling sick or vomiting

This is an unofficial leaflet produced by Professor Shoumitro (Shoumi) Deb and Ms. Bharati Limbu of Imperial College London, UK and Dr Gemma Unwin, University of Birmingham, UK with help from Cornwall Learning Disability Advisory Group. The project is funded by the National Institute for Health Research (NIHR), UK and sponsored by ©CNWL NHS Trust UK. Any adaptation or translation of this leaflet has to acknowledge fully the original source with author affiliation and copyright information and be available free of charge. 01.07.2020.

- Sore nose or sore throat
- Tearfulness
- Feeling sick or vomiting

- Not feeling hungry and losing weight (Check weight regularly)
- Feeling light-headed or dizzy
- Tics (sudden jerky movement of head and neck and other parts of the body)

Some side effects are more serious.

You should tell someone straight away if you have...

- Irritability, depression or feel aggressive
- Thoughts about harming or killing yourself
- Chest pain and problems breathing
- Fits or seizure

You should talk to your doctor before you stop taking your medicine.

Sometimes, if you stop taking your medicine, you may have:

- Irritability
- Trouble sleeping
- Increased hyperactivity

This leaflet does not tell you everything about methylphenidate.

You can get more information from:

- your pharmacist, doctor, nurse or carer/ care giver
- check http://www.choiceandmedication.org/cnwl/
- NHS on 111
- medicine information helpline on 020 3317 5090.

This leaflet can be downloaded free of charge from:
